

# Applications of 3D modeling and simulation ventilation in salt mine for safety

Andrzej Szmuk<sup>1</sup>, Kamil Piech<sup>1</sup>, Marek Borowski<sup>1</sup>

<sup>1</sup> AGH University of Krakow, Poland

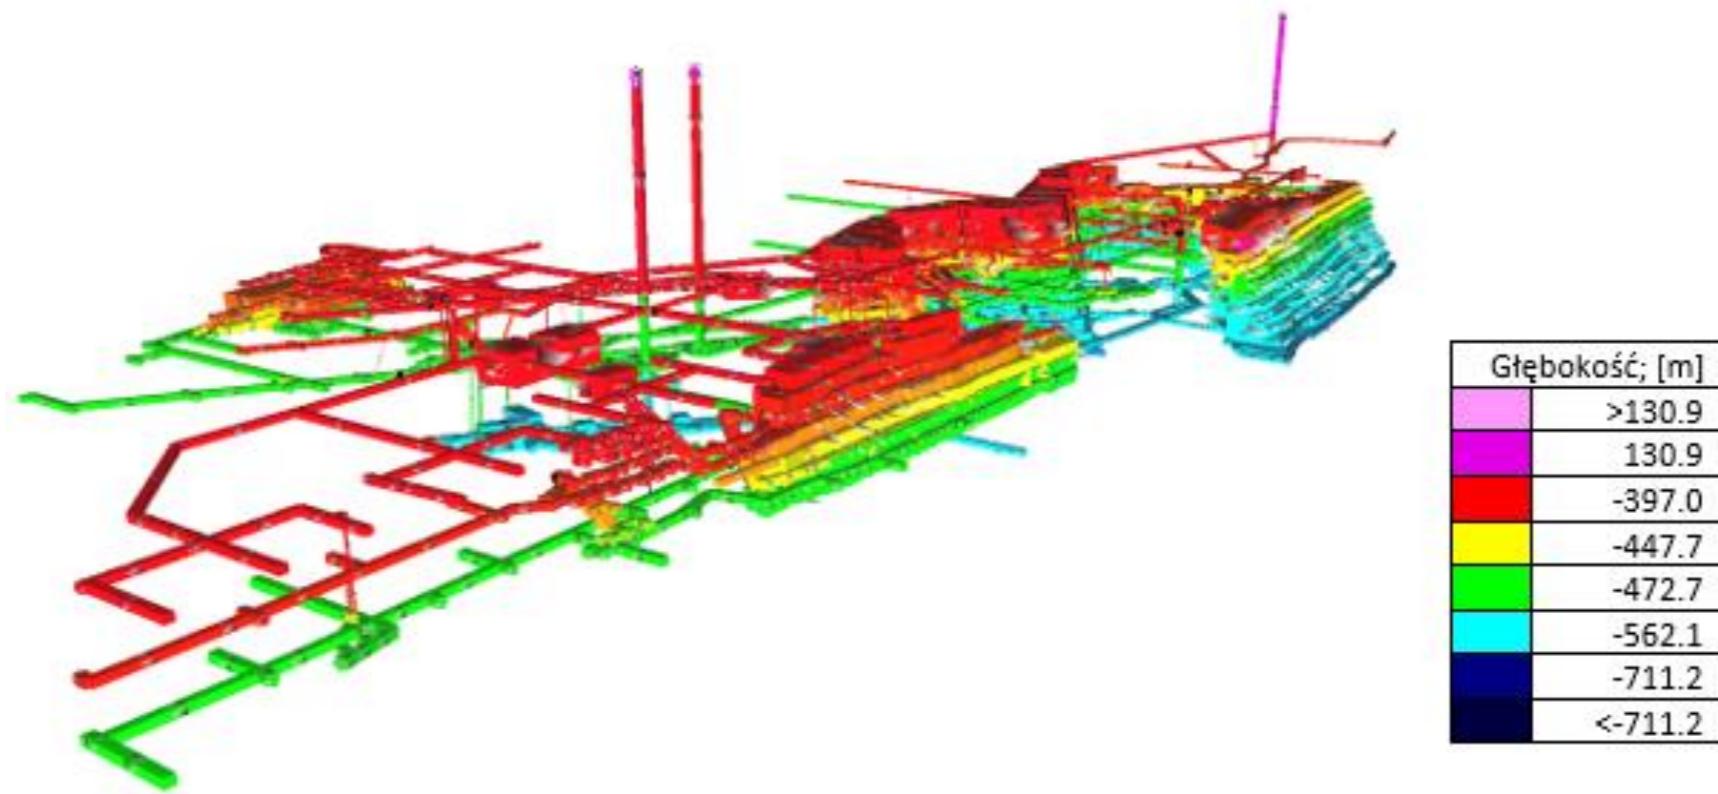

# Agenda

- Introduction
- Problems in modelling the structure of a ventilation network,
- Accuracy of the ventilation network model,
- Possibilities of stabilizing airflow in excavations,
- Summary.

# Problems in modelling the structure of a ventilation network

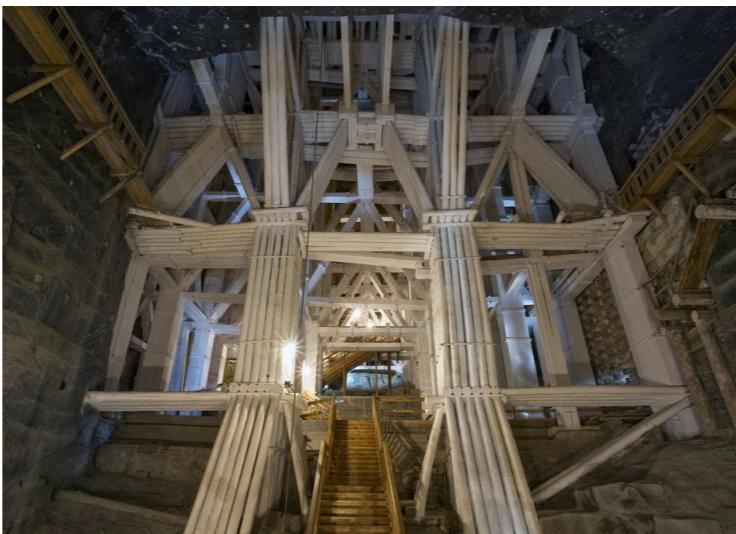

Extensive area vertically and horizontally - excavations are not being decommissioned,

# Problems in modelling the structure of a ventilation network

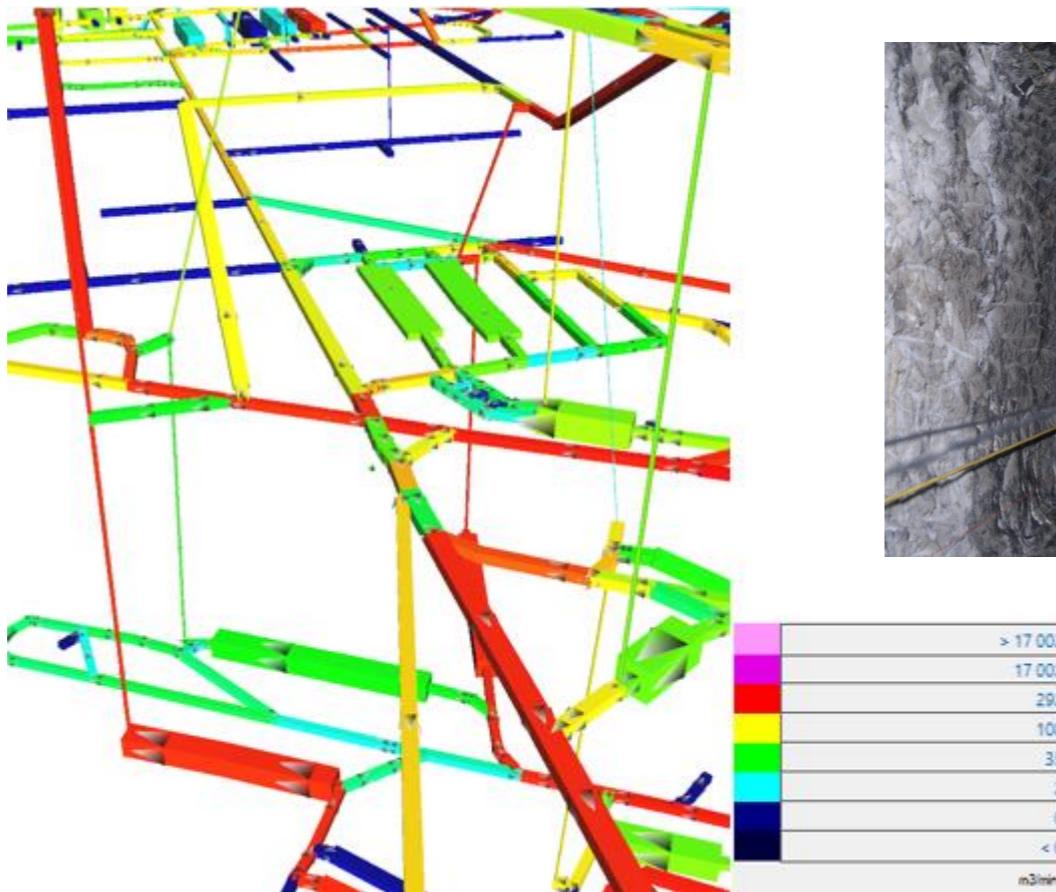

Many types of support depending on the type of rock mass

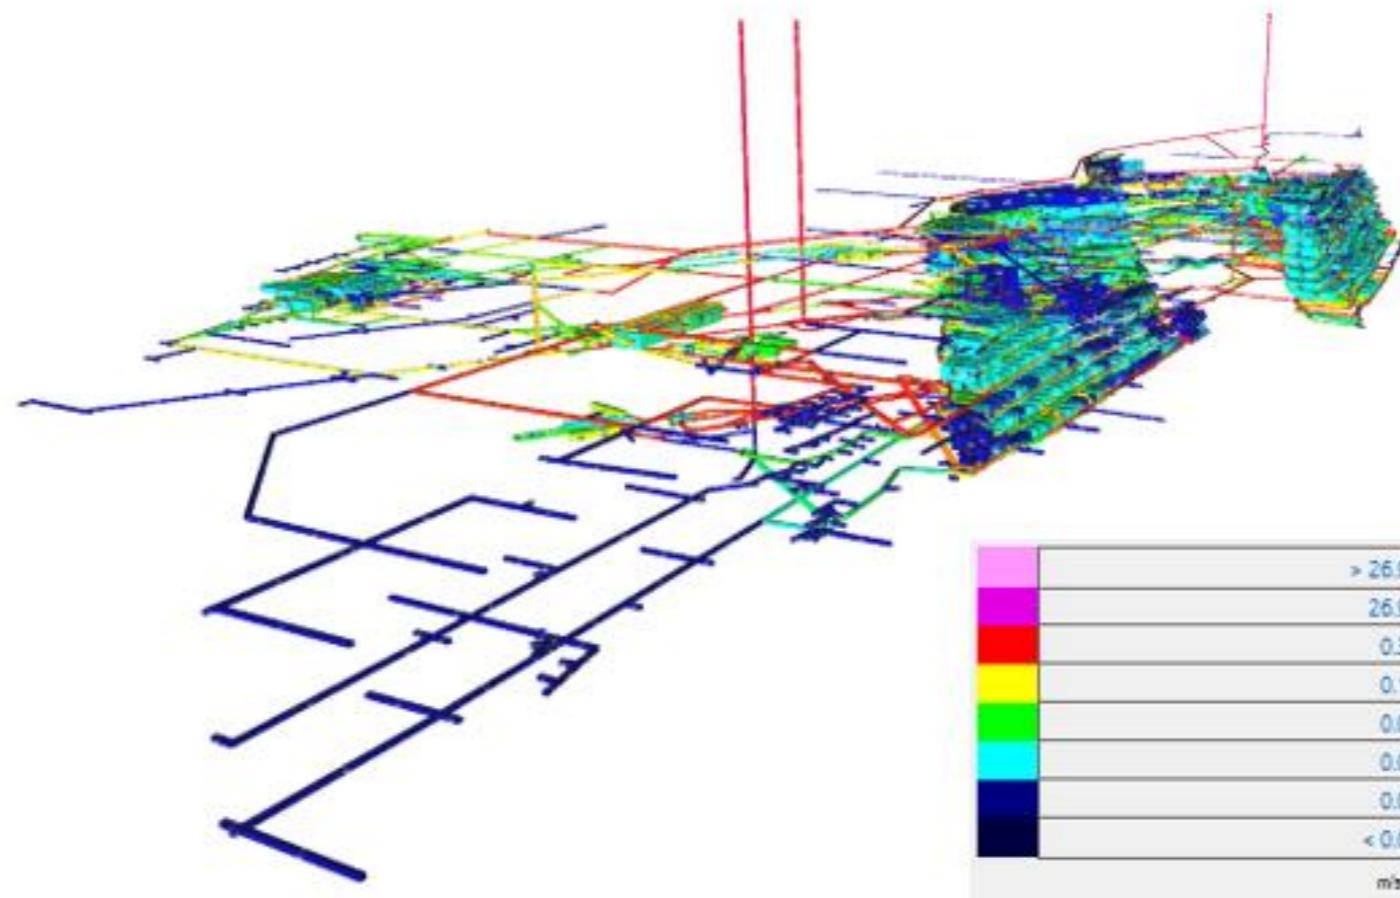

# Problems in modelling the structure of a ventilation network

Numerous vertical joints resulting from operating technology

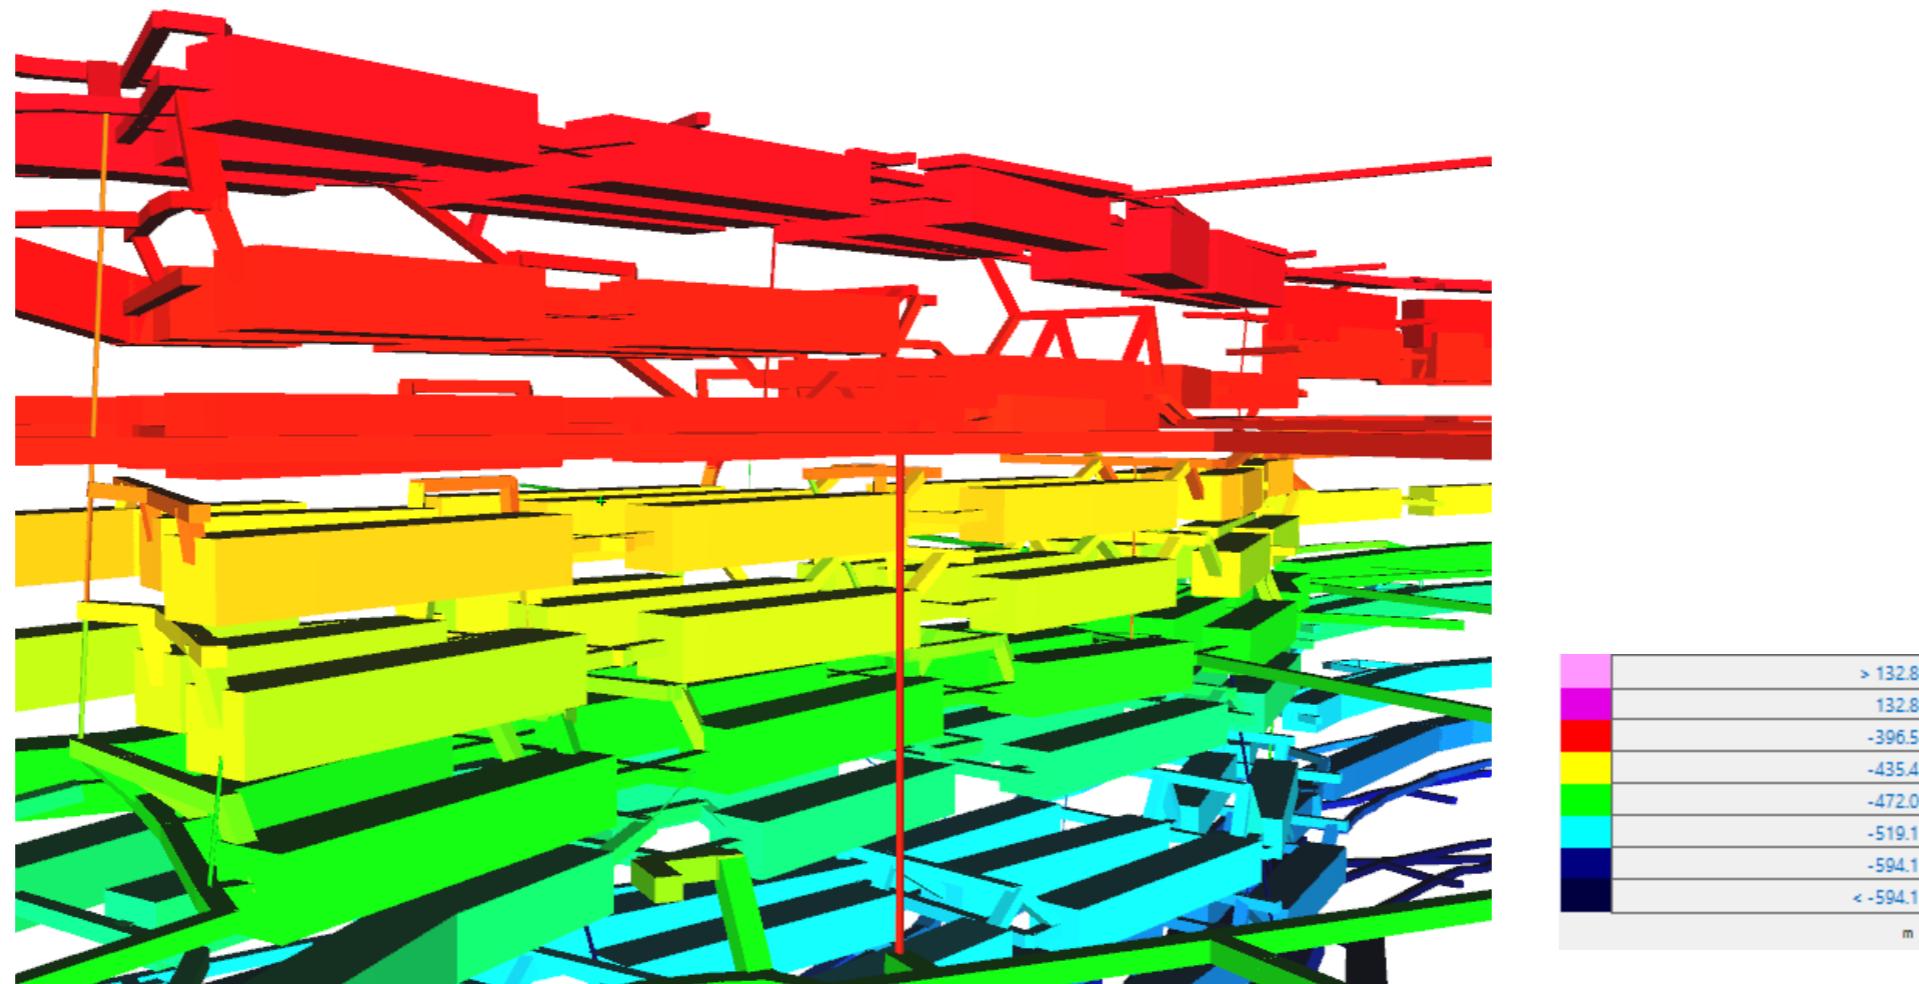

# Accuracy of the ventilation network model

Analysis of airflow in underground excavations

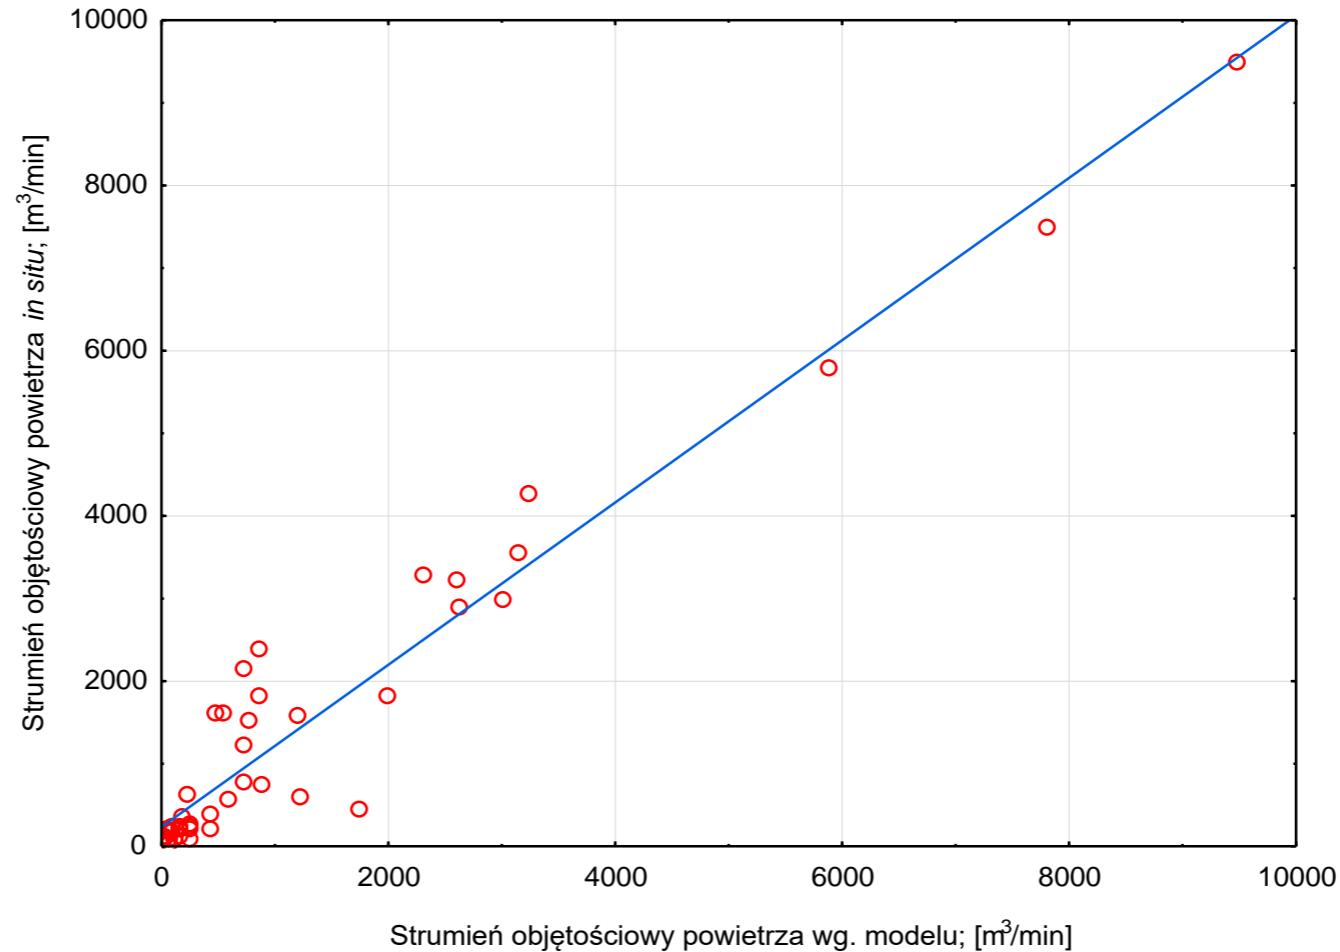

# Accuracy of the ventilation network model

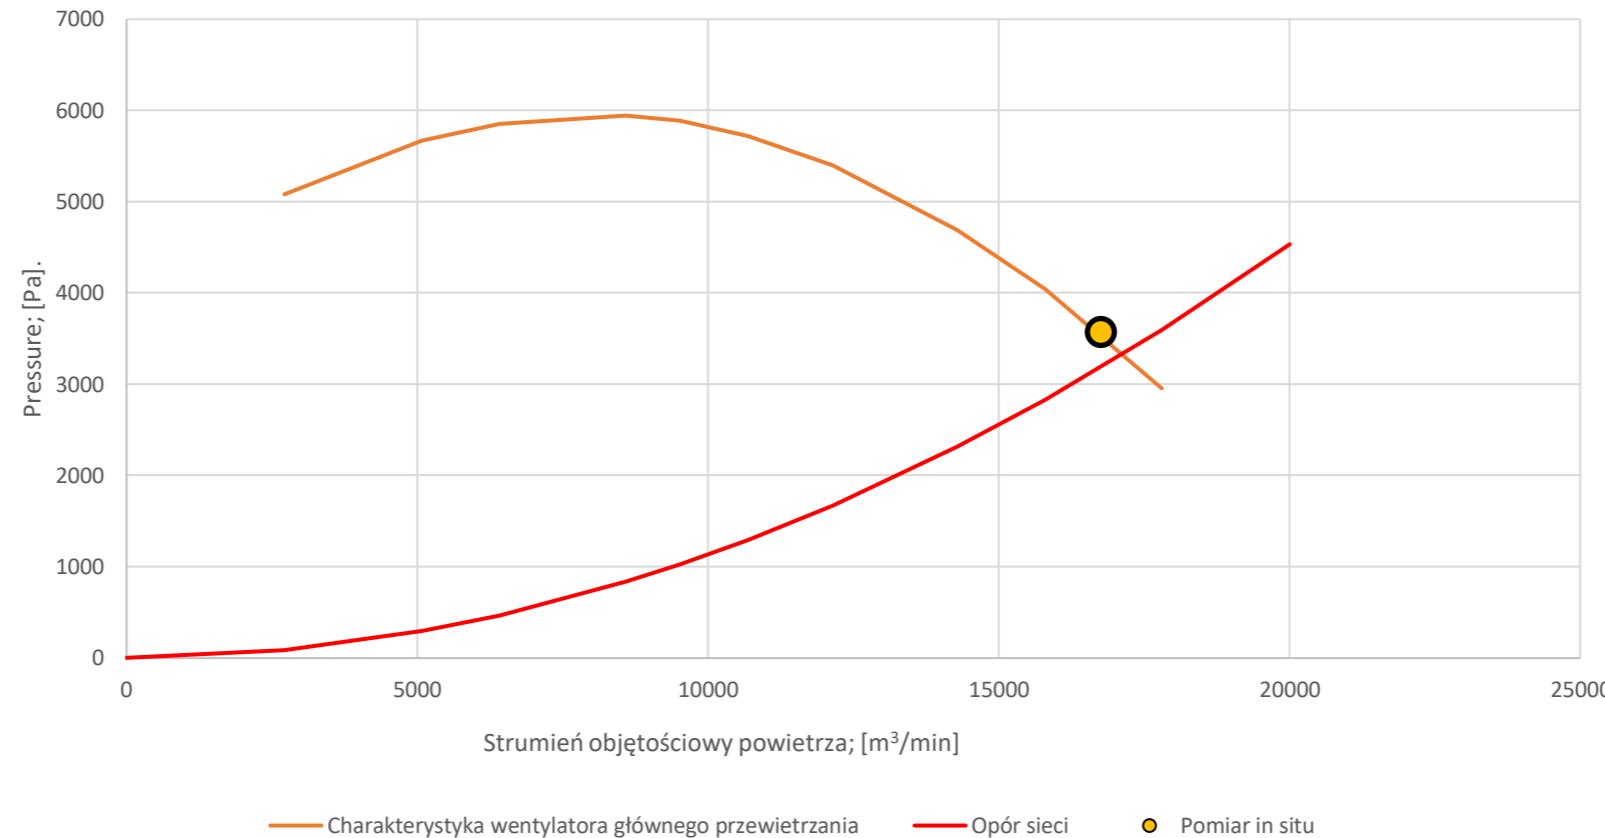

# Accuracy of the ventilation network model

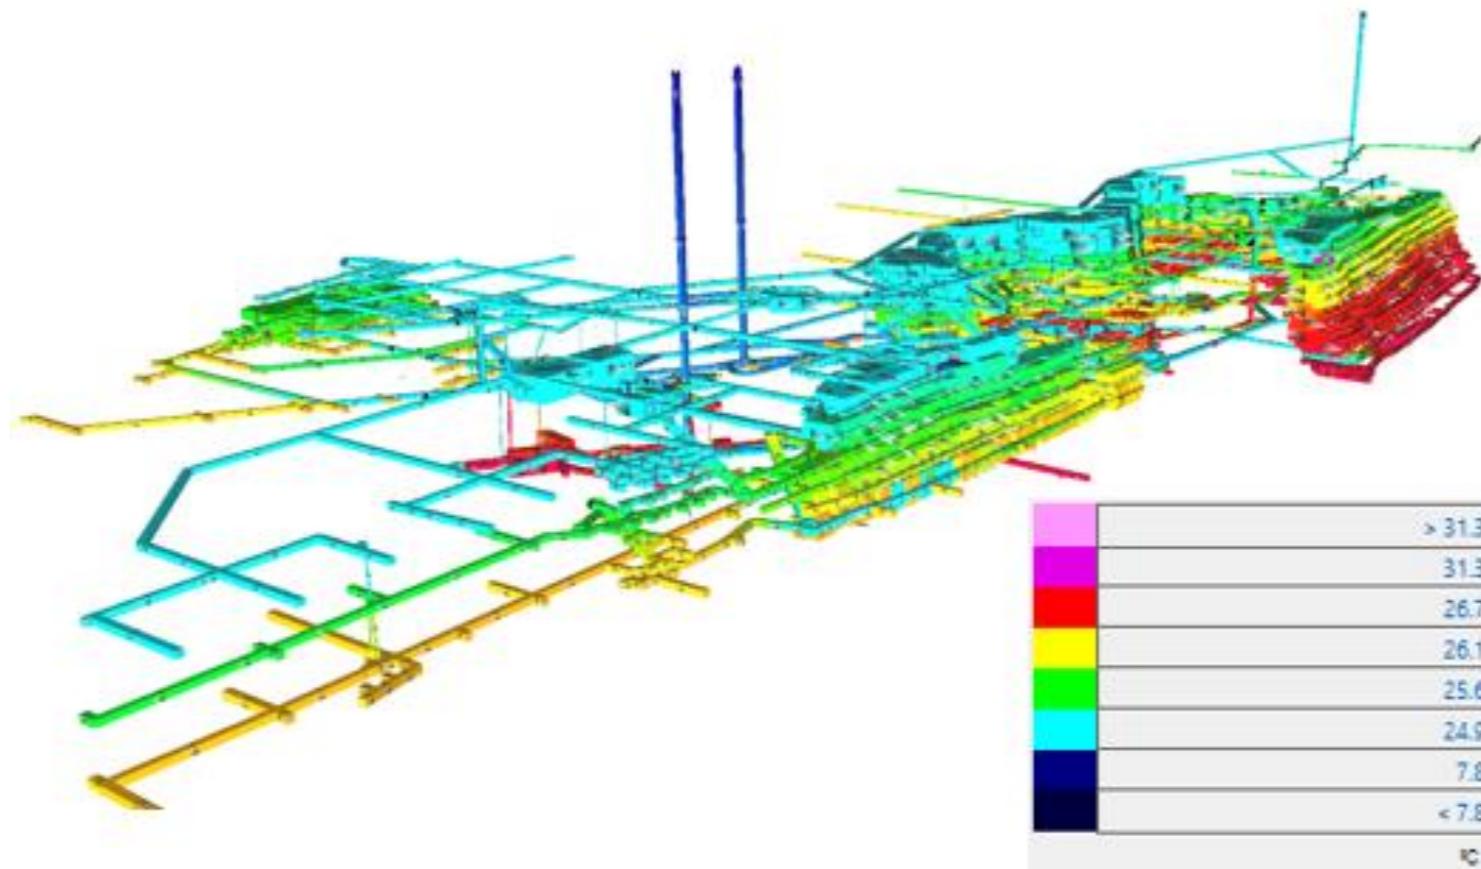

Correlation coefficient 0.967

# Accuracy of the ventilation network model

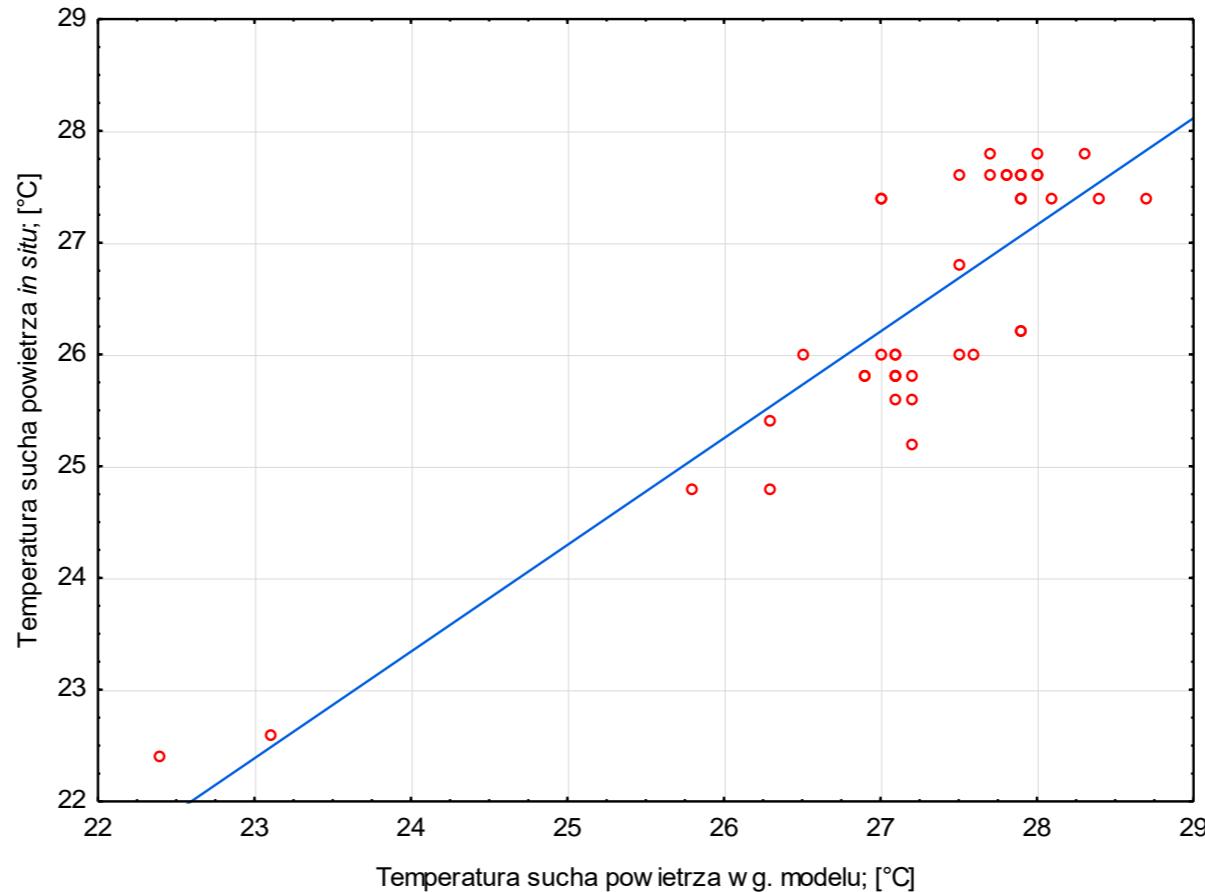

# Accuracy of the ventilation network model

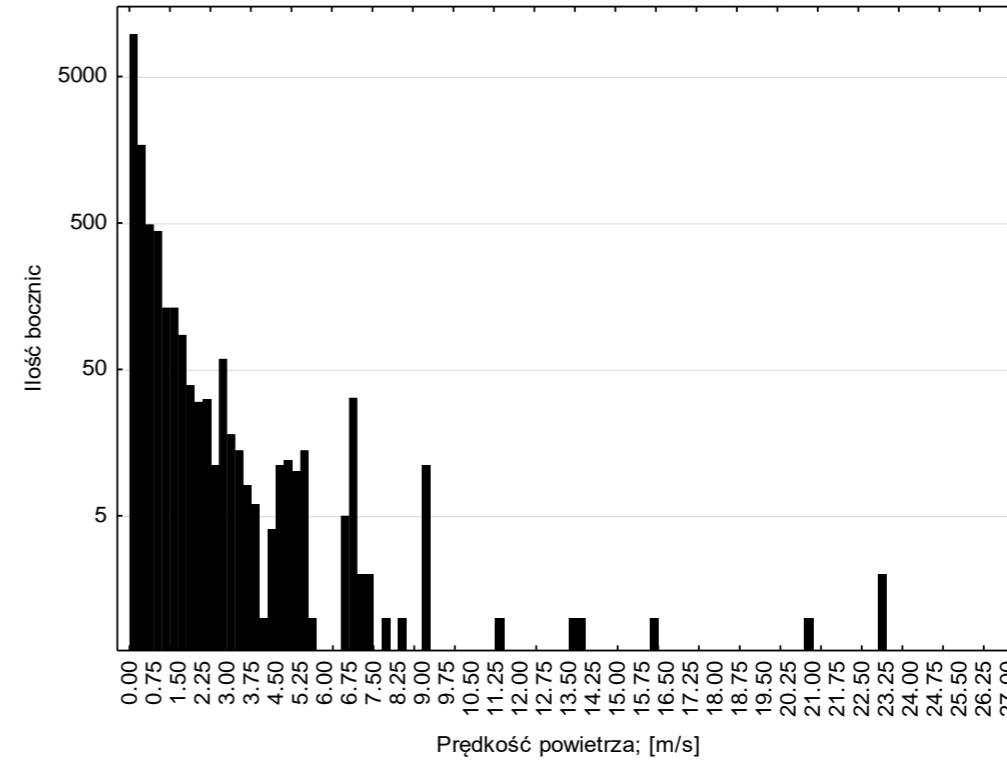

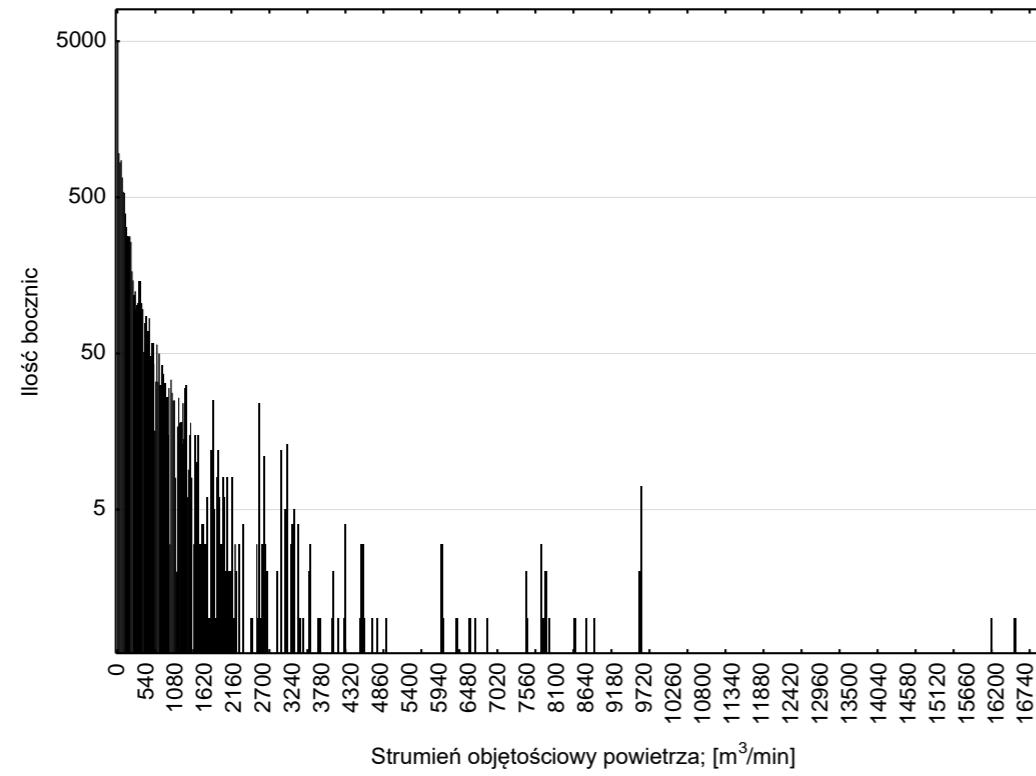

# Accuracy of the ventilation network model

Correlation coefficient 0.876

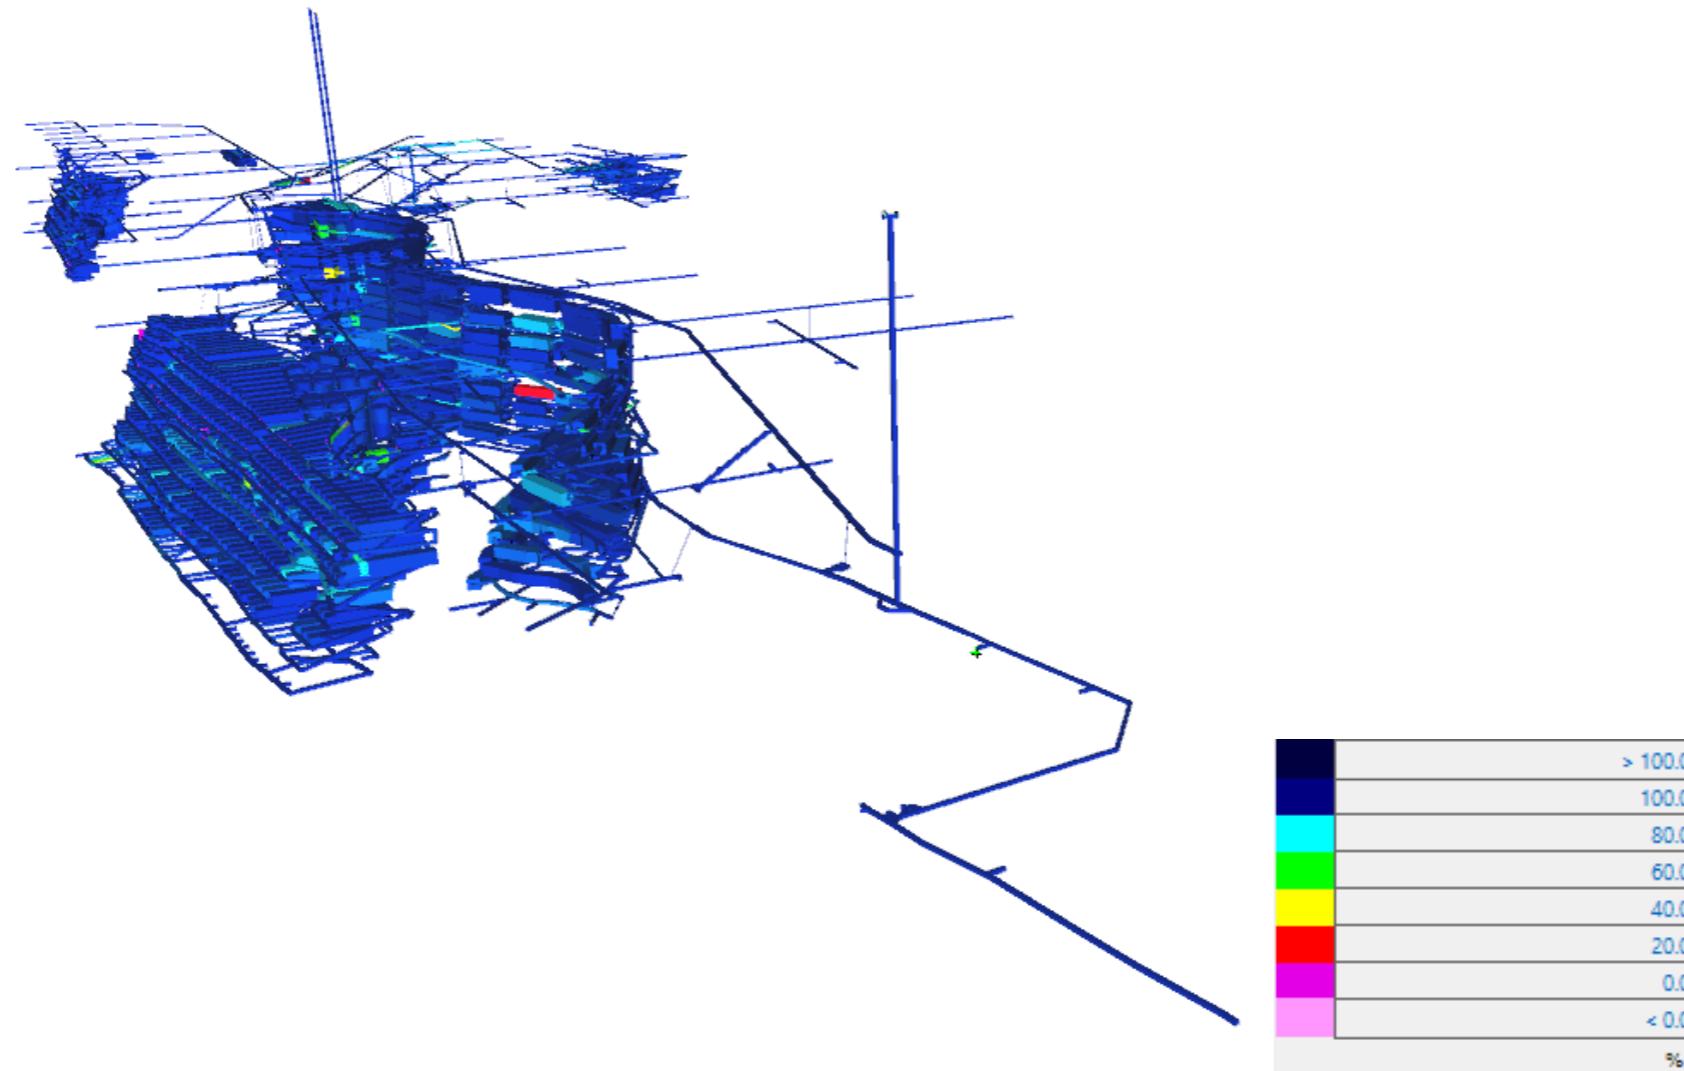

# Options for stabilising the flow rate

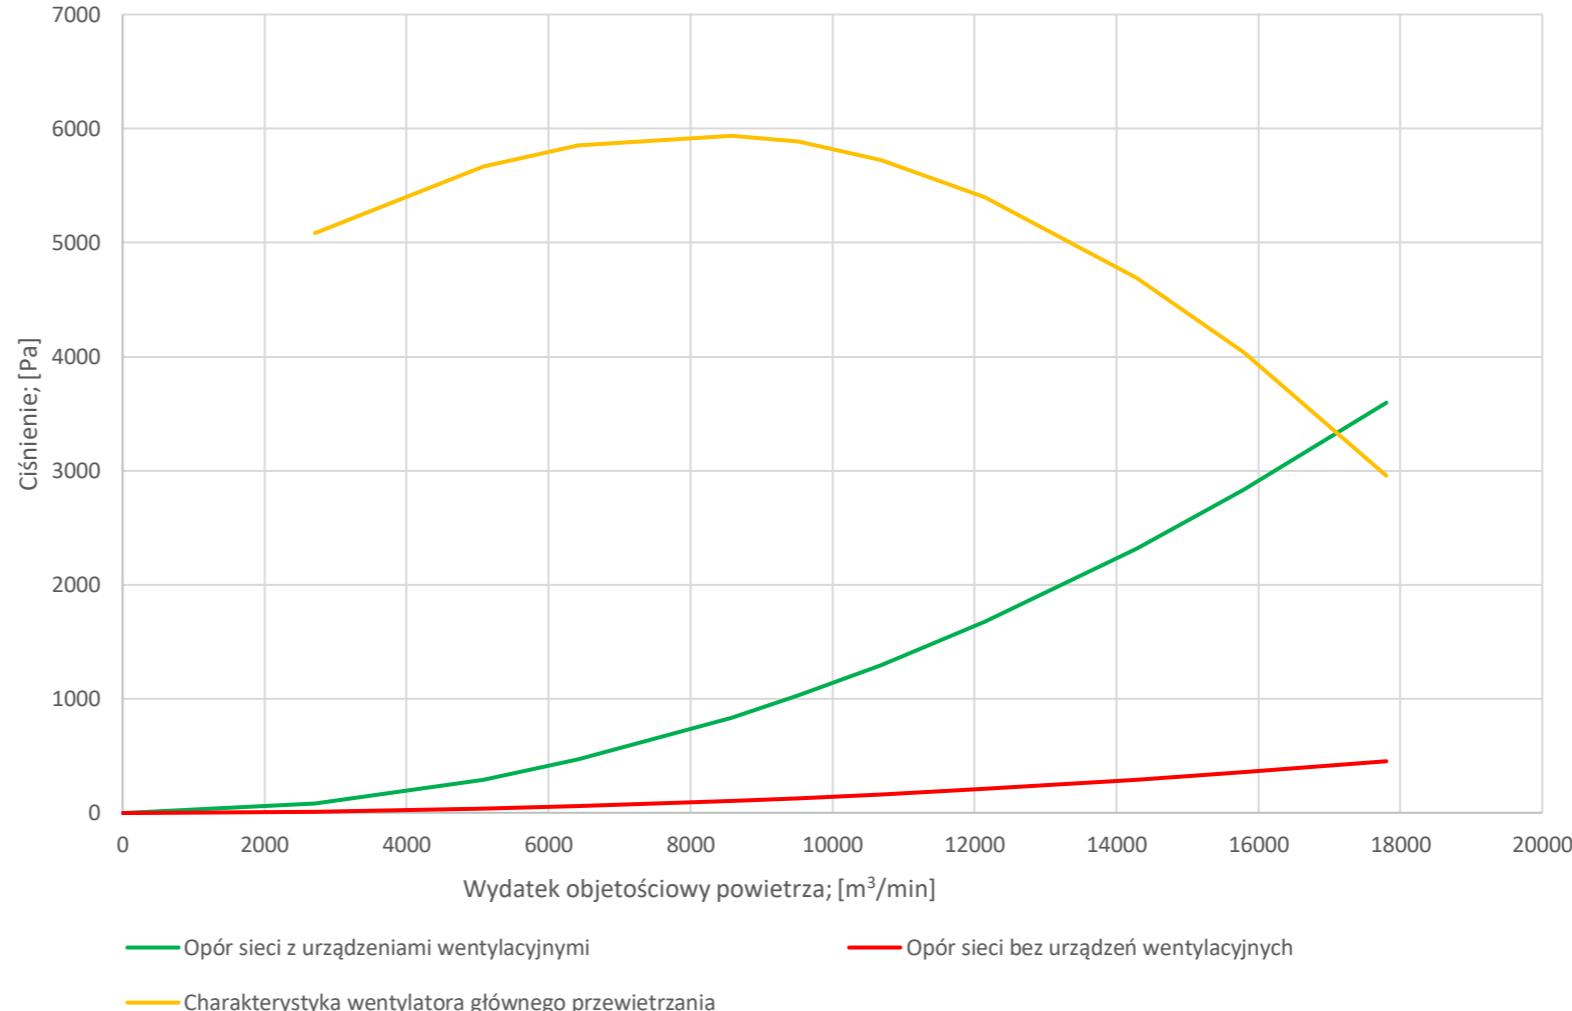

## Limiting airflow fluctuations

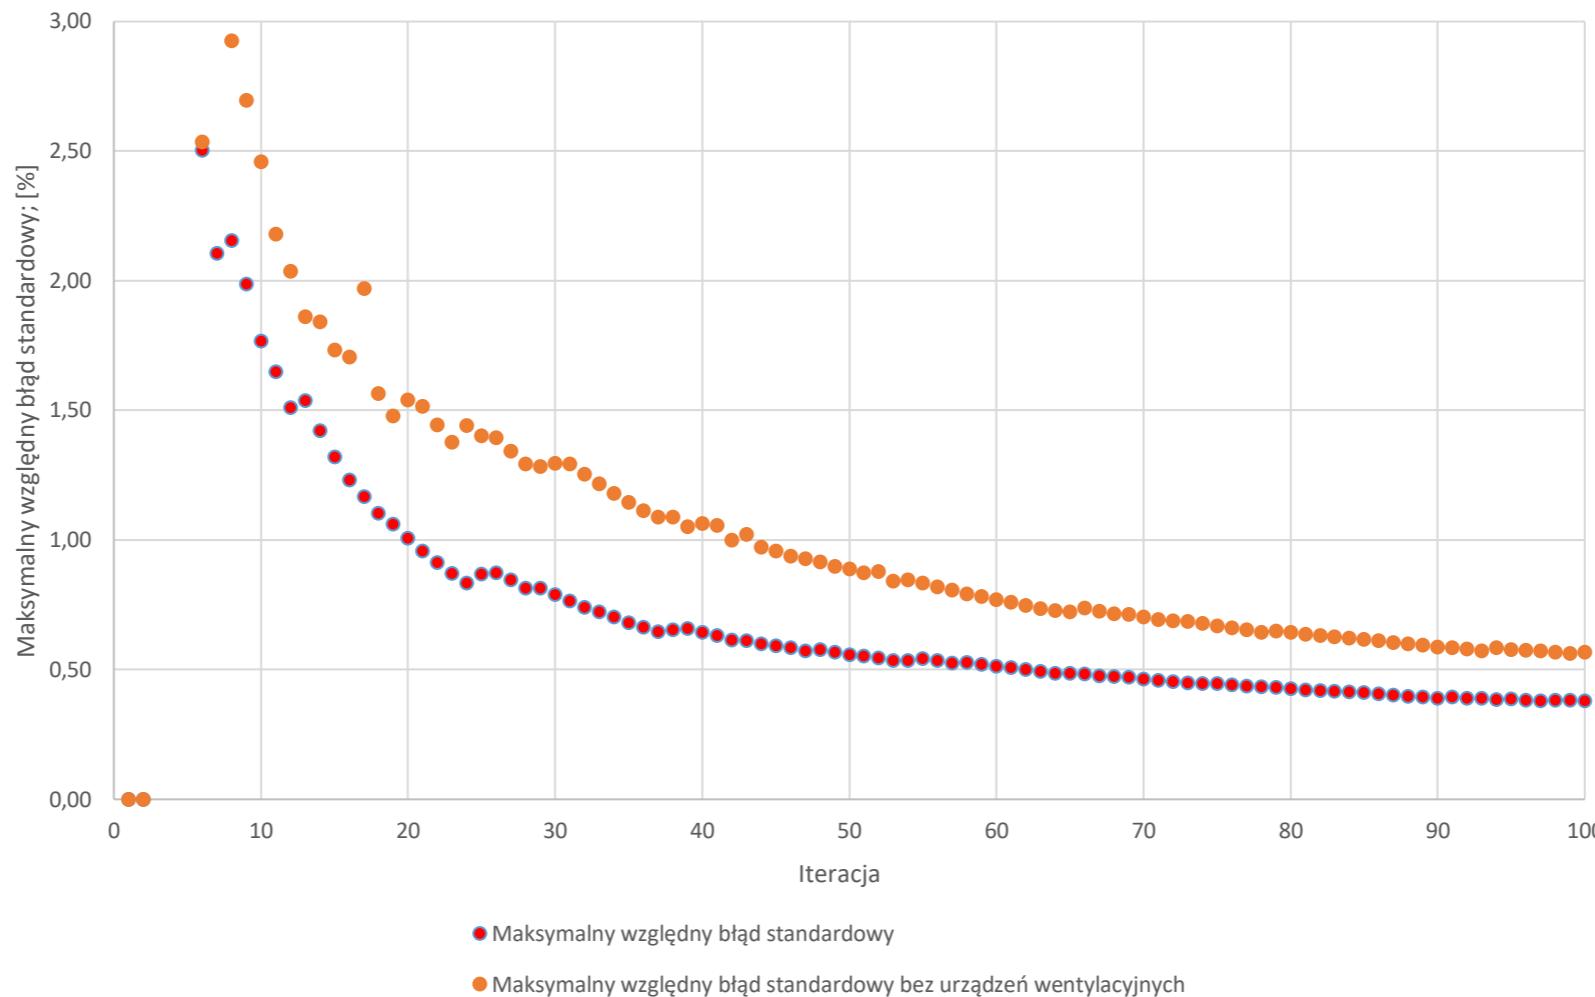

# Options for stabilising the flow rate

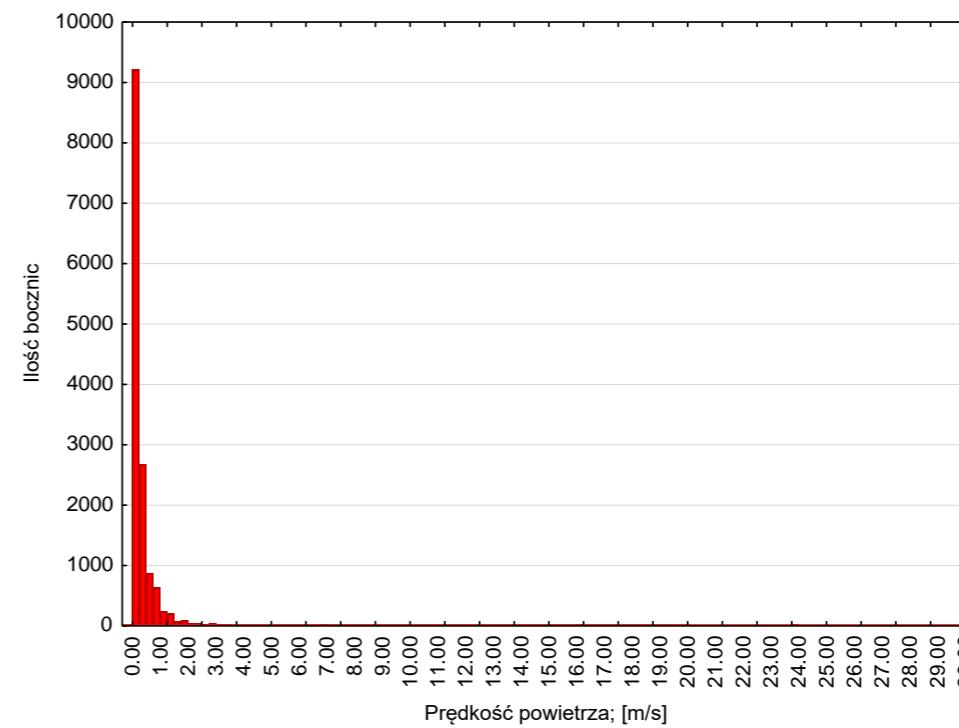

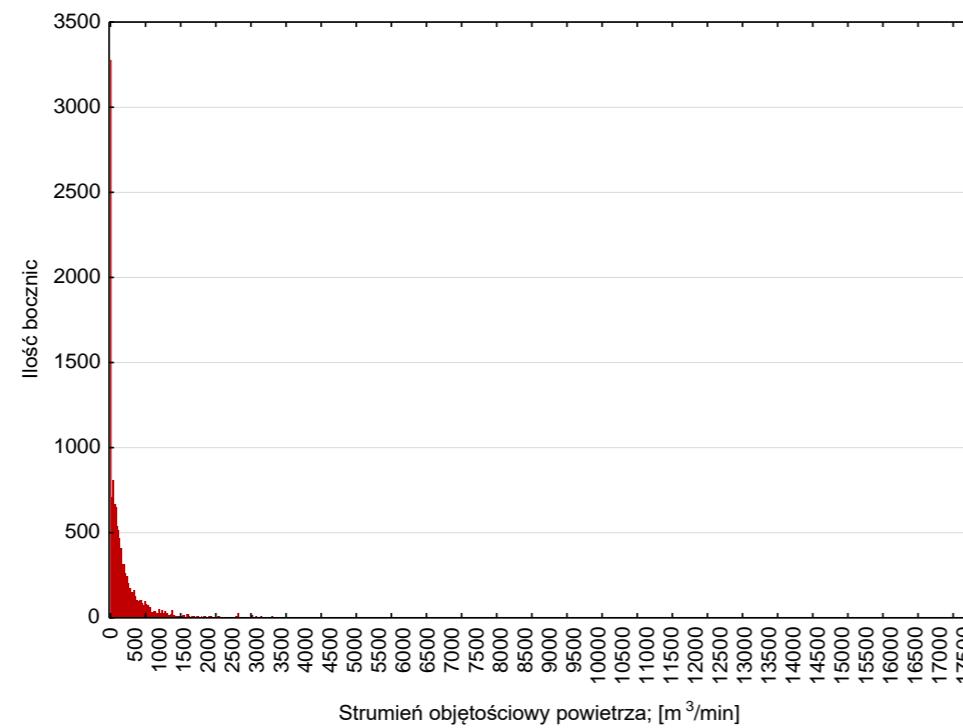

# Options for stabilising the flow rate

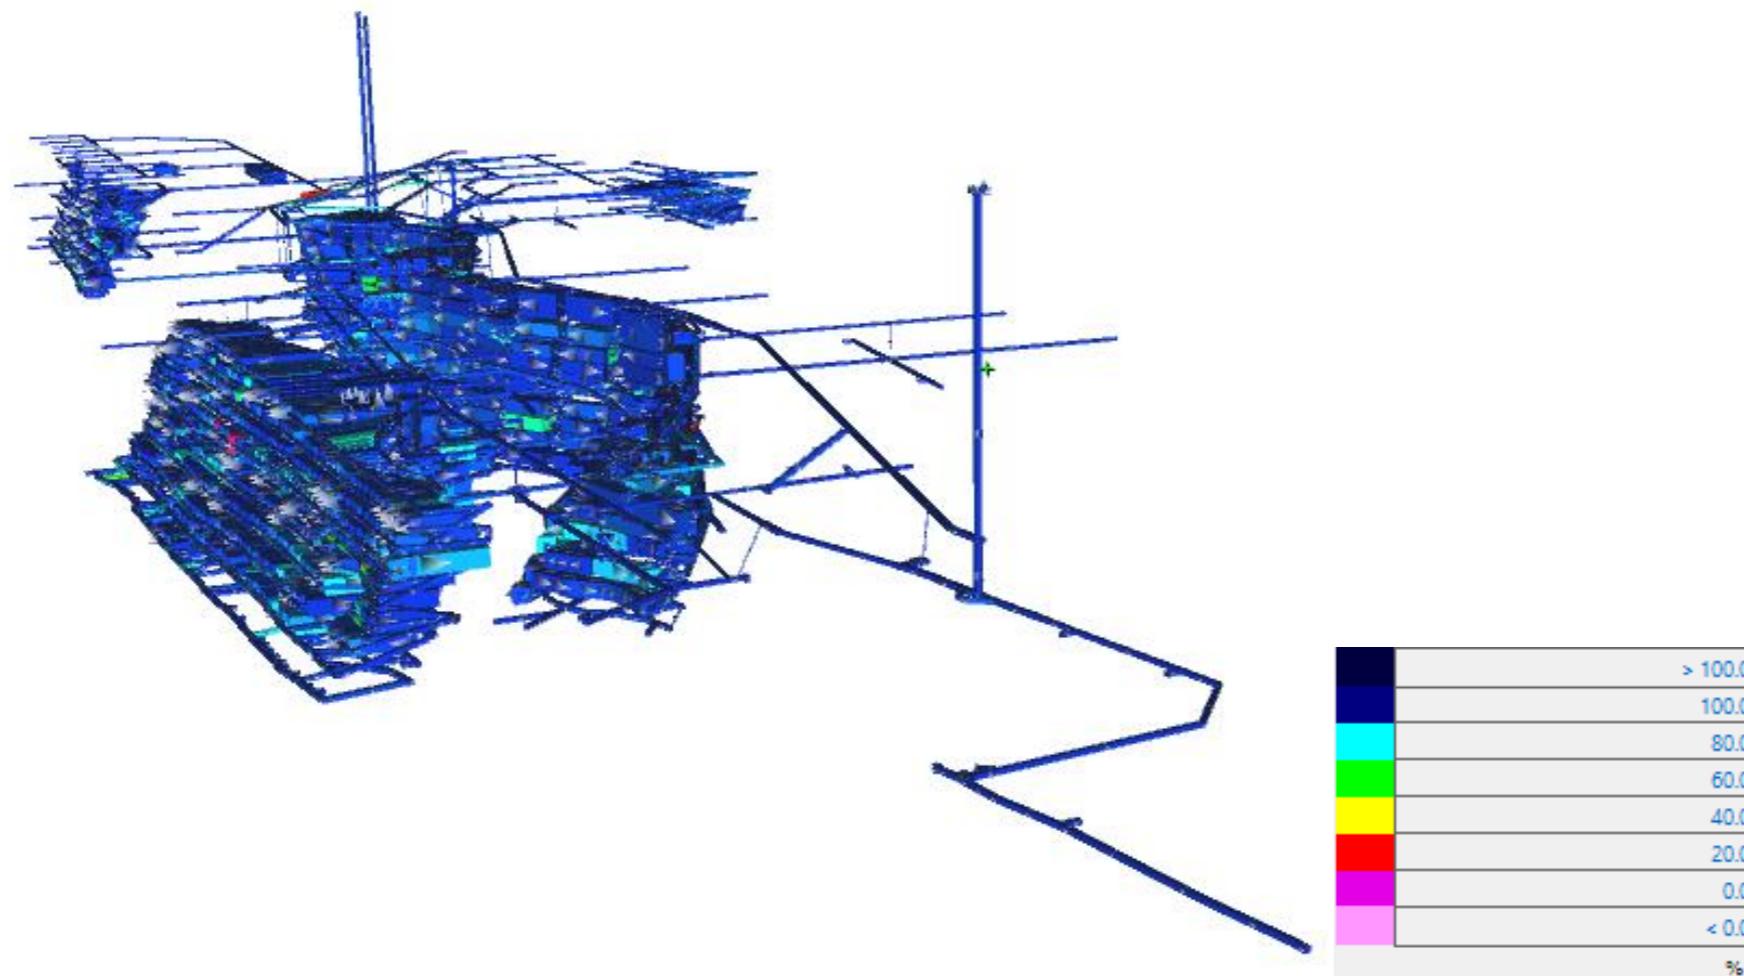

# Options for stabilising the flow rate

# Options for stabilising the flow rate

# Options for stabilising the flow rate

# Summary

- The ease of maintenance of underground excavations and their number create a numerous and complex network of ventilation connections.
- A key element in ensuring the continuity of workings is the isolation of excavations after mining.
- Stabilising the airflow in the ventilation network reduces its flow fluctuations and improves safety in case of natural hazards such as gas, etc.
